

Figure 1 displays a series of 12 ECG strips, labeled from 0:00 to 0:55 in 5-second increments. The strips show a progressive increase in ST-segment depression over time. At 0:00, the ST-segment is relatively flat. By 0:05, a small depression is visible. This depression becomes more pronounced in subsequent strips, reaching its maximum at 0:55. The QRS complex and T-wave morphology remain relatively stable throughout the sequence.
